# Medals Over Time: An Olympic Data Analysis

SQL For Data Science Capstone Project (Milestone 1)

Name: Kalyani Khond

## Client: SportsStats

(Olympics Dataset – 120 years of data)

SportsStats is a sports analysis firm partnering with local news and elite personal trainers to provide "interesting" insights to help their partners.

#### Project Proposal

The Olympic Games feature a wide range of sports, from traditional events like athletics and swimming to newer additions such as skateboarding and surfing.

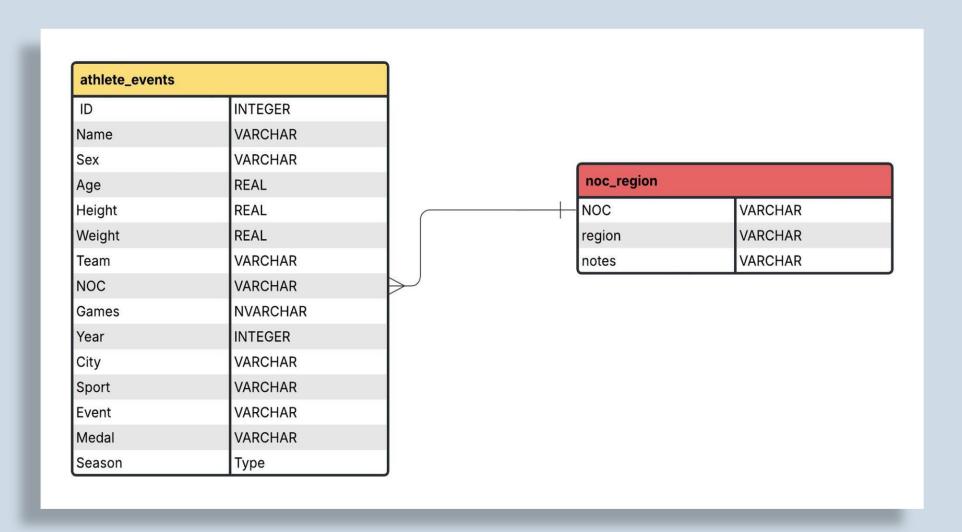

Over time, new sports have been added, and more countries have taken part. This means the number of athletes, events, and medals has grown a lot. The dataset shows interest in the Olympics over 120 years and highlights changes in which countries perform best at the Olympics. It helps us explore how athlete demographics, like age and gender, have shifted over the years.

This Olympic dataset can be useful for sports analysts, researchers and Sports Federations. It helps study how countries have performed over time and how participation has changed. National sports bodies might use it to plan training or understand medal trends.

Students and fans can also explore it to learn more about the history of the Games.

In this project, the dataset was used as-is without any cleaning. The analysis was based on the raw dataset to reflect the original Olympic records and preserve the integrity of the data.

#### > Entity Relationship Diagram

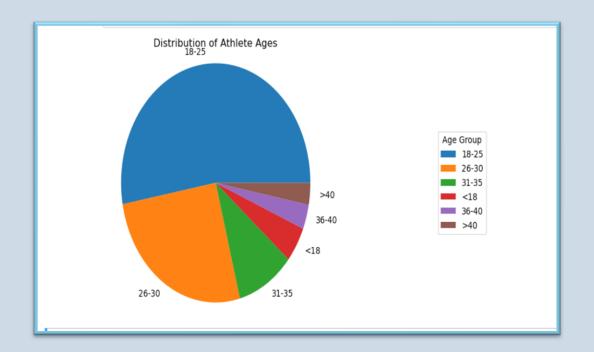

#### > Initial Data Exploration

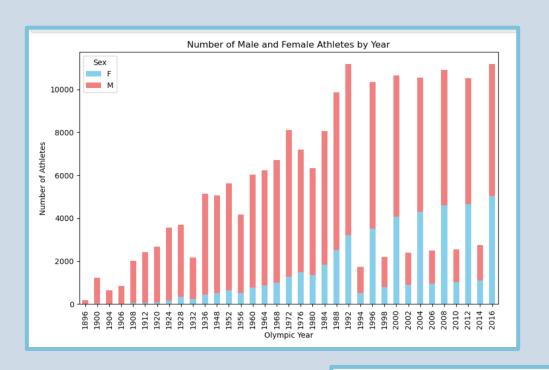

The dataset was loaded using pandas and queried with pandasql. Basic functions like .info() and .describe() were used to understand the structure.

A histogram showed the number of male and female athletes over the years, while a pie chart displayed the age distribution of participants.

This gave a simple overview of the data.

| Name                        | Sex | Age  | Height | Weight | Team           | NOC | Games          | Year | Season | City        | Sport            | Event                              | Medal |

#### Questions

- 1. How has the ratio of male and female participants changed over the years?
- 2. How does the age of an athlete affect his/her performance in the competitions?
- 3. What is the relationship between height of participants and the sport they play?
- 4. Is the performance of a nation in the Summer Olympics correlated to that in the Winter Olympics?
- 5. Do certain sports have a higher proportion of young or older medalists?

### Hypothesis

- 1. The ratio of female to male participants in the Olympics has steadily increased over time.
- 2. Athletes performance declines with age. Athletes physical strength and agility generally decreases as they grow older.
- 3. There is a relationship between an athlete's height and the sport they participate in, suggesting that certain sports tend to attract athletes with specific physical characteristics
- 4. A nation's performance in the Summer Olympics is correlated with its performance in the Winter Olympics.
- 5. There is a variation in the age of medalists across different sports, indicating that some sports are dominated by younger athletes while others see greater success among older participants.

#### > Approach

- Depending on the question, the data can then be grouped or aggregated using columns such as Year, Sport, or NOC.
- Specific filters can be applied, such as including only medal winners or focusing on a particular Olympic season.
- Calculations like average age, participant count, or total medals are then performed to uncover trends.
- Finally, the results are visualized using charts such as bar plots, pie charts, or line graphs to better interpret the findings.
- The key columns to look for the analysis include Year, Sex, Age, Height, Sport, Medal, Season, and NOC.
